

# SPARK® Secure

The next-level security upgrade, available to new and existing customers

As industry leaders in providing commercial WiFi solutions to a wide range of organisations, part of our ongoing managed service ensures that every aspect of your network, from software to hardware, is installed and maintained with the utmost safety in mind.

SPARK® Secure is an enhanced security feature that takes minutes to install, offering our customers and their end-users an extra layer of protection to their network and WiFi access.

## What you receive from upgrading

The current SPARK® Gateway, used in deployment, is a stateful Firewall with rules in place to protect us and you from external threats. SPARK® Secure provides added security by ensuring that the SPARK® Gateways cannot be tampered with, by protecting it with next generation antivirus capability.

The quality of this service is underpinned by using the latest malware and virus definitions and machine-learning, pattern recognition technology to identify unknown threats. Security experts are constantly updating the security sensors to keep the gateways protected, giving you the peace of mind to focus on your core business and we'll take care of the rest.

## How SPARK® TSL helps safeguard you and your users

SPARK® TSL already has several high security measures in place to maintain the safety of organisations and end-users. SPARK® Secure is designed to provide an enhanced level of protection from malware, viruses, and phishing attacks.
